

PLUGS and SOCKETS - KEY

To connect electrical devices to the primary alternating current supply (AC) in a building we use power **plugs** and **sockets**.

1. Do you know the difference between plugs and sockets? Match the words to the definitions:

- PLUG** → It is the movable connector attached to a device. It is made of plastic and it has two or three metal pins (also called male) that fit into the holes (or female) in the sockets.
- SOCKET** → It is a device fixed on the wall and connected to an energised electrical circuit.

2. Label the picture with the words in the box:

socket pin plug cord
